Email notifications of Motion Detection alarms

To set up email notifications on the camera Motion Detect Armed needs to be enabled. You can test the sensitivity to get the level you need. To send an email when triggered enable Alarm Mail Notification. We recommend not using a personal email account as the sender. It is best to set up an email account for the camera. We have had the best luck with Gmail. Some email providers have on occasion blocked an email account because they think the camera is sending spam. It is best not to get locked out of your email and to only use it as the receiver. Gmail is generally pretty lenient as the sender.

Here are some sample email configurations you can try:

Sender: cam1example@gmail.com

SMTP Server: smtp.gmail.com

SMTP Port: 465

Need check: yes   ('Need Authentication' on the web UI)

SSL: TLS

SMTP User: cam1example@gmail.com

SMTP Password: cam1example gmail account password

Receiver 1: youremail@domain.com
